

Based on the actual requirements and limitations of current technology, this paper proposes a coupled system of liquid air energy storage and air separation unit (LAES-ASU).

In the energy storage process, the influences of a reduction in discharge of the energy storage air (an increase in the amount of the energy storage air absorbed by LPC) on the distillation ...

In this paper, we propose a novel air separation unit with energy storage and generation (ASU-ESG) that integrates the air separation unit (ASU), liquid air storage unit ...

Compressed-air-energy storage (CAES) is a way to store energy for later use using compressed air. At a utility scale, energy generated during periods of low demand can be released during peak load ...

Low-temperature air separation equipment is a high energy consumption link for large chemical systems. If it is combined with liquid air energy storage technology, it can effectively balance the load ...

As the foundation of heavy industry, the energy-intensive air separation industry is characterized by high operating costs. In response to these challenges, this paper proposes a coupled system of liquid air ...

The liquid air energy storage (LAES) system offers advantages such as high energy density and strong flexibility and is often coupled with external energy source

Integrating air separation units (ASUs) with a liquid air energy storage (LAES) system offers enhanced revenue potential for LAES and a reduced payback period through shared use of ...

Liquid air energy storage (LAES) is currently a highly promising large-scale energy storage technology. Coupling ASU with LAES equipment can not only reduce the initial investment for...
