

Generator air inlet position

To prevent the return of hot air, the inlet of the diesel generator set should be as far away from the exhaust outlet as possible, and the air in the machine room should be allowed to flow directly.

The generator set should be located so that the engine receives air from the cold point of the room. If two or more units are installed, avoid placing the heated air from one unit into the inlet of the second ...

The most effective way to do this is to provide a ventilation air source low to the ground at the rear of the package. It is also good practice to include air intake filters on the engine room ...

Learn how to properly maintain your commercial generator's air inlet system and air filter from Generator Source's EGSA-certified technicians.

To ensure sufficient air circulation in the engine room, the net intake area should be at least 1.5 times the effective area of the generator's radiator core. If the intake area is too small, it can ...

The primary regulator & hose can be run out a hole in the intake side for hot weather use, or on the exhaust side for cold weather use where the exhaust air keeps the tank at a moderately ...

When discharging air vertically, because the generator is surrounded on all sides, can result in higher than ambient air temperatures being pushed into inlet vents.

When possible, position the engine end of air cooled generators in line with the air inlet per the manufacturer's recommendation. When possible, position liquid cooled engines with the engine end ...

In order to prevent the backflow of hot air, the air inlet of the unit should be as far away from the air outlet as possible, and the air in the machine room should be as direct as possible.

Generator sets must be properly installed to ensure that cooling air is not restricted or artificially heated by nearby heat sources or from recirculation. Fortunately, installation influences can be simulated ...
