

This information is provided to aid in the safe and proper installation of Generator Systems.

Chapter 8.1 of NFPA 37 on the Design and Construction of Engine Exhaust Systems addresses the requirements for engine generator exhaust and provides a few simple guidelines for the exhaust ...

It calculates heat loads, required airflow, and intake/exhaust area sizes for different equipment configurations including generators running, generators off with radiator fan cooling, and generators ...

The exhaust system shall be installed according to the manufacturer's installation instructions and shall conform to all applicable state and local codes.

Why do generator exhaust systems need to be properly designed? Generator exhaust systems need to be properly designed to ensure correct engine performance and safe operation.

Generator sets must be properly installed to ensure that cooling air is not restricted or artificially heated by nearby heat sources or from recirculation. Fortunately, installation influences can be simulated ...

What is the intake/exhaust area of a generator? velocities and a louver free area of 50% is used. Total required intake/exhaust areas are presented for the number of active generators and transformers. ...

Proper ventilation of the generator room is necessary to support the engine combustion process, reject the parasitic heat generated during operation (engine heat, alternator heat, etc.), and purge odors ...

This exhaust extension allows for safe venting of exhaust fumes from an unoccupied enclosed area - this will allow your expensive unit to stay dry and secure while maintaining portability.
