

High voltage switchgear does not store energy

Is high voltage switchgear a greener and smarter transmission system?

This contribution highlights some important research and technology trends in high voltage (HV) switchgear development for reaching greener and smarter electricity transmission systems. In AC transmission, the focus is on the replacement of SF 6, which is a strong greenhouse gas, in HV switchgear.

What is high voltage switchgear?

High voltage (HV) switchgear is crucial for the transmission and control of electric power in power grids[1 - 3]. It includes HV AC circuit-breakers (CB) of live tank type (LTB), dead-tank type (DTB) and gas-insulated switchgear (GIS); see Fig. 1. Requirements are defined in international standards, e.g., [4,5].

What is a switchgear disconnecter?

At the core of the switchgear assemblies is the disconnecter. Together with the earthing switches on either side of the isolating gap, the disconnecter ensures the safe insulation and earthing of de-energized circuits.

What is high-voltage HVDC transmission?

With the need to electrify the global energy system, high-voltage HVDC transmission will play an important role for transmission of electric power from remote renewable energy sources, such as offshore wind installations. Today this is done by radial HVDC network structures for both wind power and hydropower.
