

How to use solar power boiler

Are solar panels compatible with a boiler?

Before we get into boiler compatibility, let's clarify the two types of solar panels: Solar Thermal Panels: These heat water directly, feeding it into your hot water system. They're typically paired with a hot water cylinder and are ideal for reducing the demand on your boiler for hot water.

Do electric boilers work with solar PV panels?

If you're all-in on renewable energy, an electric boiler paired with solar PV panels is a match made in eco-heaven. Electric boilers, like those from brands such as EHC or Fischer, run entirely on electricity, so the power generated by your solar PV panels can directly reduce your boiler's running costs.

Can solar panels power a boiler all year round?

In order for solar panels to work effectively at powering a boiler all year round, the hot water heated by the solar energy during daylight hours needs to be saved and stored for later use in an additional hot water cylinder, though this defeats the point of having a nice compact combi boiler that fits neatly into your kitchen cupboard.

Can a system boiler work with a solar thermal system?

System boilers are a brilliant match for solar thermal panels. They're designed to work with a separate hot water cylinder, which can store the hot water generated by your solar thermal system. When the solar-heated water isn't quite hot enough (hello, British weather), the boiler kicks in to top it up.
