

What is a microgrid control system?

The microgrid control system ensures safe, effective, affordable and reliable power supply to consumers by controlling the demand response through dispatchable generation and loads in a microgrid. Microgrids are low or medium voltage grids without power transmission capabilities and are typically not geographically spread out.

Why is a microgrid necessary?

A microgrid is necessary for facilitating and sustaining a coordinated integration of renewable sources of power generation with the distribution network. It comprises of a group of interconnected loads and distributed energy resources with clearly defined electrical boundaries.

What is an isolated microgrid?

An isolated microgrid is a power grid that operates independently from the main power grid. It is deployed in areas that are remote from a wider power grid and need to ensure continuous and reliable energy supply without sufficient renewable sources. The choice of power sources often depends on the costs of fuel for such installations.

What is demand-side management in microgrid control systems?

Demand-side management (DSM) is a powerful tool that facilitates the process of transforming conventional microgrids into green systems. In this chapter, DSM in microgrid control systems is investigated from various perspectives. First, the history of DSM is briefly presented and basic concepts are introduced.
