

New chromium iron flow battery project

Researchers at the Pacific Northwest National Laboratory have created a new iron flow battery design offering the potential for a safe, scalable renewable energy storage system.

China's first megawatt-level iron-chromium flow battery energy storage plant is approaching completion and is scheduled to go commercial.

Iron-Chromium Flow Batteries are safer, scalable and cost-effective. Discover why this original NASA-era innovation is poised to lead the LDES market today.

Iron-based ARFBs rely on the redox chemistry of iron species to enable efficient and cost-effective energy storage. Understanding the fundamental electrochemical principles of these ...

Researchers affiliated with UNIST have managed to prolong the lifespan of iron-chromium redox flow batteries (Fe-Cr RFBs), large-capacity and explosion-proof energy storage ...

A research team led by Professor Hyun-Wook Lee at UNIST, in collaboration with KAIST and the University of Texas at Austin, has achieved a major breakthrough in improving the lifespan of ...

This paper summarizes the basic overview of the iron-chromium flow battery, including its historical development, working principle, working characteristics, key materials and technologies,...

UNIST researchers developed bismuth-coated electrodes that boost iron-chromium flow battery efficiency to 75%, solving key barriers to commercialization of this explosion-free, low-cost ...

A commonplace chemical used in water treatment facilities has been repurposed for large-scale energy storage in a new battery design by researchers at the Department of Energy's ...

A team of battery researchers, collaborating across multiple countries, just made a huge breakthrough for iron-chromium redox flow batteries.
