

New York electric grid malabo

Will New York's electric power system face a shortfall next summer?

New York's electric power system may face shortfalls in supply starting next summer due to rising consumer demand and power plant retirements outpacing new construction.

Is New York grid at a significant inflection point?

The New York Independent System Operator (NYISO) warned that the grid is at a significant inflection point and needs "several thousand megawatts of new dispatchable generation" within the next 10 years.

How many megawatts will NYISO need in the next 10 years?

NYISO Senior Vice President of System and Resource Planning Zach Smith said the system may need "several thousand megawatts of new dispatchable generation" within the next 10 years, depending on future demand and retirement patterns. The STAR report projected shortfalls in New York City and on Long Island within the next three years.

Are aging power plants a threat to New York City?

The decade-long CRP recognized the state's reliance on aging plants as a major threat. About 25% of the state's total power comes from plants that have been operating for over 50 years. The CRP estimated that about 3,000 megawatts of fossil-fuel power could be lost unexpectedly by 2034, with 60% of that risk concentrated in NYC.
