Can banana waste be converted into energy?

Scientists believe they've found a game-changing solution. Scientists have identified several pathways to convert banana waste into energy sources such as biogas, bioethanol, and biochar. These methods not only reduce waste but also offer sustainable alternatives to fossil fuels.

Is banana biomass a potential energy source?

It is noteworthy that peel, leaves, and BPS have 16.15, 15.04, and 16.16 (MJ/Kg) higher heating value (HHV) respectively and 17.57, 14.80, 13.63 (MJ/Kg) lower heating value (LHV) respectively (Kabenge et al., 2018). It makes the banana biomass a potential energy source.

Can banana peels generate electricity from microbial fuel cells?

Although several research studies focus on generating bioelectricity from banana peels through a microbial fuel cell, no research studies compare the electric generation capacities of the different varieties of banana peels. So, this study aimed to evaluate the electric generation capacities of the three varieties of banana peels.

Can bananas be used to generate electricity in the Philippines?

In a 2018 report, the majority, or 84%, of the total banana production in the Philippines was grown in Mindanao regions 9, 10. Since the banana fruit generates a large quantity worldwide, particularly in the Philippines, exploring its possible uses in electricity generation is exciting and vital.
